On freezing, nitroglycerin expands 10121 of its entire volume which is greater than any other liquid. Dynamite. The different types of high explosives used for blasting vary widely in their properties. Some are exceedingly quick, some relatively slow, and others are intermediate in quickness. Different types of explosives also vary in density from the heavy gelatins to some of the coal mine powders, which are very light. High explosives are graded according to their strengths compared on a weight for weight basis with the straight nitroglycerin dynamites, which are the only type containing the actual percentages of nitroglycerin as designated. The other types make up their strengths by the use of such explosive substances as organic nitrosubstitution compounds, explosive salts and guncotton. The high explosives used for blasting in the United States are divided into three popular classes: Straight Dynamite, Ammonia or so-called Extra Dynamite, and Gelatin. The First Dynamite...
